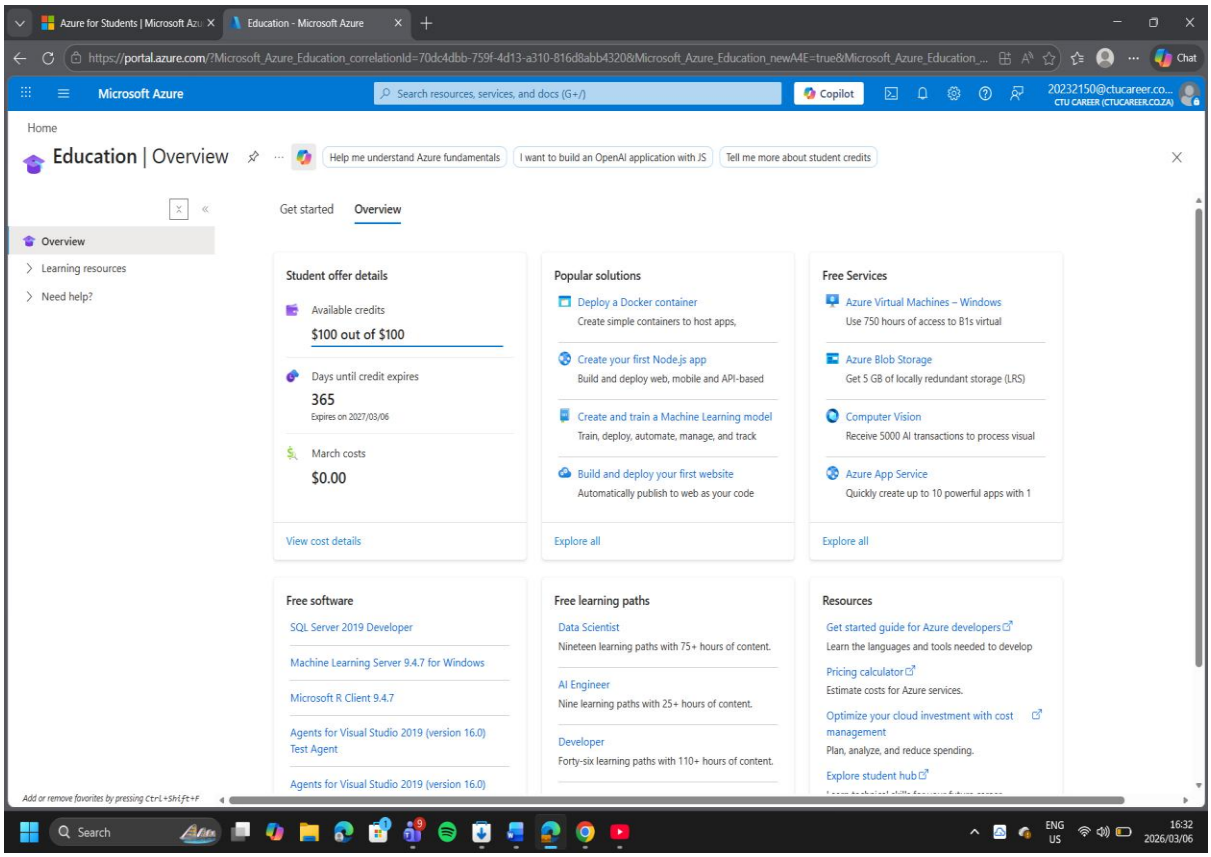
NET 732 WEEK 1

Task 1 : Setting up Azure for student



Task 2: Define business requirements.

CTU Training Solutions is a medium-sized higher education institution that has 1000-2000 students and 100-200 staff nationally. Its purpose is to deliver quality education, support student learning, manage administration, enables collaboration with staff, students and parents and lastly to equip young adults with better skills they will need for the workspace.

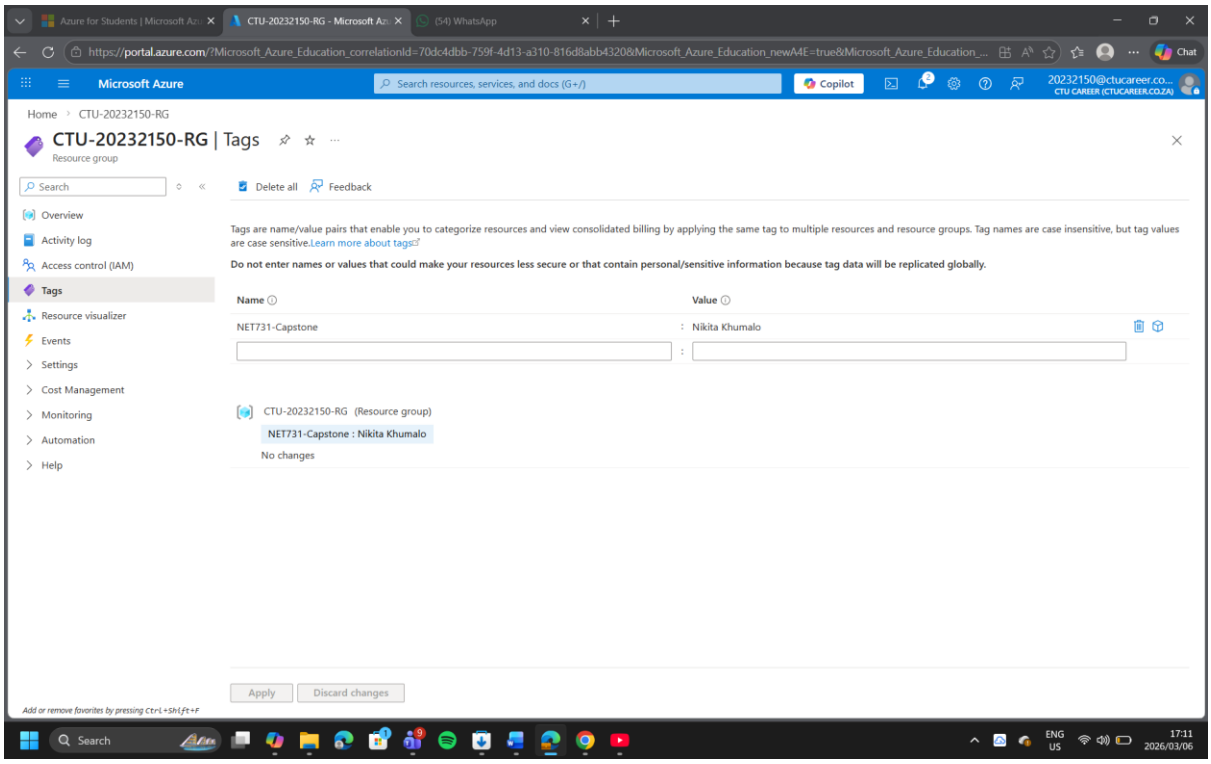
Its main IT needs include:

- The staff needs access to administrative systems, HR, payroll and teaching resources.
- The students need access to learning management systems, collaboration tools, online assessments and secure access to educational content.
- In germs of data there is student records, attendance, grades, financial data, and infrastructure information. Schools need these types of data to make space for improvements.

Azure is better than on-premises servers because it allows schools to scale resources up and down depending on enrolment and demand, it reduces upfront hardware costs and ongoing

maintenance, staff and students can access resources from anywhere supporting hybrid learning especially because CTU Training Solutions has campuses across the country. Cloud services provide continuous updates and security patches. And lastly Azure has built-in redundancy and backup options.

The security and compliance requirements that need to be considered are:

- The data needs to be protected therefore it needs to comply with the POPIA act of South Africa.
- The access control needs to give according to the position each person has. (enabling RBAC)
- Sensitive data like financial data and students' personal data needs to be kept safe.
- Cloud governance frameworks need to ensure secure use of resources.
- Information will be safeguarded against phishing, ransomware and authorized access


Task 3 Create your own resource group.
